The man or woman saw fight to talk, walk or sit, is someone who hasto tell and a life of successes to be proud. one of these patients is professor emeritus martin marivate mb, chb, dip obstet (cmsa) fog (sa.) while he was convalescence convalescenceAfter surgery, we took a moment to talk to his famous father's son (also Martin). Maude, Professor Martin and Martin (Junior) Marivate. Prof. Martin Marivate studied medicine at Natal University. At that time, only the average English universities in South Africa admitted black students. Wits and UCT were completely open to all races, but Natal University admitted all races, but had segregated classrooms. In 1958 there were only 188 black students at the entire university. Son Martin tells us that his father played a role in the fight against apartheid, but says that his father is typically modest on it. Despite the obstacles against him, Martin Snr. he graduated with a medical degree specialized in Osetricria and Gynaecology, and continued to become a global authority on twinned pregnancy. He is co-author of many research documents on the subject, sharing honors with other obstetricians from Australia and the United States and is quoted extensively in textbooks and other research articles. Prof. Marivate's first career was spent at the King Edward VIII Hospital in Durban where he worked and passed his knowledge teaching at the medical school. King Edward VIII Hospital opened its doors in 1936, and was originally intended to be used only by black people. It was built on a site of 42 acres which was one of the residences of King Shaka - KwaKhangele Amankengane. The hospital takes its name from King Edward VIII of England, who abdicated the throne a week after the opening of the institution. In 1991 his teaching work led him to the Medical University of South Africa (MEDUNSA) where he worked until retirement in 2000. MEDUNSA will continue to be amalgamated in various different tertiary educational institutions, which end up as the Sefako Makgatho Health Sciences University (SMU) in 2015. In his personal life, Martin and his wife Maudeparents to five children. His son Martin (Jr) says he has always been a loving lovand that when his last students visit or meet his father, they always react with joy and tell him that they hold their father in high esteem. What can be said more for a man whose life work has shifted around the health of mothers and children in risky pregnancies? For Colin Miller, a trip to Vic Falls for a family wedding would also be the brutal start of a constantly evolving journey. It was here that Colin, who had just turned 21, was attacked by two crocodiles and approached with wounds to his head, face and left arm. Her facial injuries were superficial and her head wound as she was alarming was not threatening life. His arm, however, was in tatters under the elbow. Luckily for Colin, a quick reflection by an agent applied a tourniquet to stop the bleeding and paramedics responded in a few minutes. He was transported by plane to Johannesburg, where he had a month's stay at Sunninghill Hospital. Here doctors had to amputate their arm to a point where the meat was still healthy. All in all, Colin had to undergo six operations, as well as fight several very bad infections. After a month in the hospital, Colin was ready to graduate in a rehabilitation facility and Bryanston Subacute was all. A month in the hospital, fighting for his life left Colin needing physical rehabilitation. The physiotherapists of Bryanston Physio and rehabilitation have risen and have made him work on a daily physical routine that helped him to rebalance his balance and move again with confidence. In addition, the team put it through some intense therapies to help prepare its stump for a prosthesis, including the mobilization of the scar tissue (a massage therapy that remodels the scar tissue), the activation of the shoulder stabilization muscle, the desensitization of cloth and the release of thesnap (release of nodes contracted muscles). The other therapist you saw a lot was James Gower, our psychologist. James held individual and family sessions with Colin and his parents, helping them all adapt to thesealter the wounds and understand and accept the salts and bass to come. Colin still has points and a little healing to do, but he visited the prosthetic, Adrian Singh. Adrian brought a myelectric prosthetic test arm to see if he was suitable for Colin. As you can see from Matron Rosemary's video, Colin can control the hand by moving the muscles of the upper arm, after only about 10 minutes of trial. This is something that makes it an ideal recipient of this type of hi-tech prosthesis. Colin had a second rating before going home that went well, in fact, so well he managed to give us an inch up. Now his case of getting funding and the process to get his new arm will begin. Once its hemp is completely healed and the points are removed, it will suffer a nice couple of weeks with a special elastic bandage at the end of its hemp to compress it and stabilize the fabric in a more conical form. Once the stump is a stable shape and texture, a plaster mold will be made of it. From this a grip will be made to fit perfectly to its fabric. The electrodes that control the arm are embedded in the socket and finally the arm is attached to the socket and Colin comes to learn how to handle it and use it. In general, Adrian Singh estimates that Colin has another 10-12 weeks to go before he is fully armed and ready to go. Colin and his parents Jenny and Keith along with the prosthetic, Adrian Singh His parents, Jenny and Keith were stalwart supporters throughout this ordeal. They enjoyed the change from the hospital to our sunny patio, but are eager to take Colin home to Zambia in the coming days. It is from home that you prepare your arm for the prosthesis and if everything goes well, you will return to Johannesburg in the next two months to begin the next step in the journey to get the arm. Matron RosemaryColin and his mother, Jenny the day he left us to goBefore this life change event, colin was a pilot drone, using technology in many fields such as agriculture, investigation and cinematography. While his wounds might prevent him from flying for a while, he is waiting to train others in this skill until he has his new arm and can understand how to continue despite the changes, has an incredibly realistic vision and seems surprisingly optimistic to move forward with his life (the t-shirt is testimony to his attitude. ) We wish him all the best and invite him back to visit us to let us know how to do it. will it not surprise that the holidays have returned mat loots to complete more hours of community service in his search of his gold presidents award (why we are not surprised that he has already reached bronze and silver)? what surprised us is that he came bringing a gift - the gift of a couple extra to help hands in the shape of his friend and grade companion 11 student of Hilton, cameron coley. the first day of work were kept ultra-busy, starting from the kitchen service - learn what was on the menu for the day and deliver meals to patients. welcomed a new patient, said goodbye to a patient on departure, moving furniture, walking with patients, helped to feed patients and fixed disturbing televisions. in addition to all this business, they took the time to sit and answer some questions. What is the best thing about the job in subacute bryanston? matron rosemary gave them strict instructions to say "Matron rosemary of course" but for once they disobeyed orders. ml: like the fact that you can see improvement in patients, that every day improve. cc: be able to walk with patients and talk to them. they have so much experience and can give you really good ideas about university and work choices. cameron wants to be aof wildlife and we were quite sure that it referred to the patient dave cumings from chiawa camp in zambia. It's not likeback up after a knee replacement and looks forward to returning to the bush. What are the most difficult things to work with patients? ML: Power is probably one of my less-favoured activities, just because it can be very slow. CC: Help people out of bed when they are in pain. You're paying attention as much as you can, but they complain because they're suffering. This is difficult Both found dealing with body waste would be a little discouraging. What's the only important thing you learned from working here? ML: How much time effort and resources go to take care of people. Matt wants to study engineering - it can be said that this answer comes from an analytical mind. CC: If you are in a situation where people are not enjoying, you can smile and make an effort to make their bad weather a little better. How did they work with our staff? They love the fact that our staff is passionate about the work they are doing and cheerful and helpful. They say that patients are very aware of the kindness of the staff and the professionalism that lead to their work. They add this last remark: "Sometimes a patient is rude, because he feels bad, and the staff never takes him to heart, treat that person with kindness." Thanks for your help hands and feedback! Ray and Ron do what the physio ordered - walking! In the early 1960s, two men joined the accounting company of Aiken & Carter. One of them had just left the university and the other had just finished his national service. They joined the studio a year apart. Ronald Rankine in 1960 and Raymond Horner in 1961. They followed a friendship that lasted even after Raymond left to join Bowring in the '70s. They met for social events outside the office and remained friends for the next 57 years. "We met at lunch," says Ronald. Unfortunately, about two years' Health issues caused Raymond to become less mobile, and the two friends found it difficult to meet for a meal. meal,kept in touch by Raymond's phone and wife, Anne, who owns the store, Chef' n leers in Sandton City. They hadn't spoken for at least two months when Ronald had a fall and broke his hip. His orthopedic surgeon at Morningside Clinic recommended a hip replacement. In Sandton's clinic, Raymond was under the same surgery. Both men would need some rehab and both were invited to come to Bryanston Subacute. Raymond had been assigned one of the final beds in our general department of four beds. Two of the other beds were occupied and the last was empty. Ray realized that a new patient had arrived because the two-bed tents away from his were designed. "I couldn't see who had arrived," he explains, "but I heard Ron's voice and then I heard his wife, Margaret's voice, and I understood who was there." Friends are excited that serendipity brought them to the same place at the same time. When I ask if they are encouraging to move, they announce, then Raymond gives me a look on the side and says "sometimes we feel like encouraging each other to stay in bed and sleep longer." We wish them both a quick recovery and more lunch dates outside Bryanston Subacute, once they are up and completely mobile. In January, we welcomed Jenny Williamson, a patient who had earned us in June 2017 after her knee replacement operation. This time, she returned after a spontaneous fracture of the rotula - a very rare event, in fact so rare that only 1% of the population have ever had this success. He describes his return in theatrical terms, as the staff trained to greet her and how he felt welcome. "I sang to them when I was here last time - I gave them concerts" he laughs. His popularity meant his 71th birthday on Thursday, Richard came at 5:00morning and made her a cake, something she was extremely proud of as was the first cake she made successfully. Why would a patient serene the staff? personal?jenny williamson, jenny cantan was jazz singer and blues. was in the original South African production of enjospell which was first staged at lesotho before its ban was reversed in the courts and was allowed in South Africa. her and her band - jenny cantan and cantatas played in all the best diners and dance places, including Southern Sun hotels and other places. "I went to the border and kept the troops up there," he says, laughing. "I've been the pin-up of Caprivi." the band joined the Sanmarine cruise line and entertained guests on the cruises. laughs when it recalls a particular stunt that they cooked: "The drummer made this fire that threw the battery while singing fever (the song made famous by peggy lee) except that it was too hot on the cruise line and detached the sprinklers. There were all these edgy clothes smartly sitting in a drip." You're never too old to have fun in 2012 at the age of 65, jenny decided to have fun and get into the talent of knows! did not do much more than this initial performance, but here is a video we found on youtube, that performance, recorded by one of his friends of the book club! jenny will leave us soon and we wish you all the best for his fun future! matt returned to Jo'burg for the holidays and had a week help to the matron rosemary solve his deposit. days of deposit contracts, file coverage, labeling files, put the card in chronological order followed. acquired first hand knowledge of how much information we have to have at the tips of our fingers at any given day. this presentation requires javascript, to relieve the feeling of being buried under a mountain of dead trees, took some breaks to ocire with patients and recover with staff. thank you morning! it is always a pleasure to have a couple into help your hands and your cheerful demeanour to illuminate the place! Wayne Mulders is coming home after a record record5 weeks at Bryanston Subacute. I sat down and told him about his accident trip home. Start a long and painful journey And that long and painful journey was. It started on Sunday 2 July when it slipped and fell from a height in a river in Mpumalanga. When he fell, Wayne suffered severe facial injuries, including a broken nose and hospital and sent to a rehab clinic. Unfortunately, his encounter with the river left him vulnerable to bacteria. An infection set, and the resulting swelling around its spine caused paraplegia. "I can feel the feeling from my feet up," he recalls. He was sent to the hospital for further surgery and to fight the infection. After three long months he was finally ready to move on, but where? While visiting the hospital, Wayne's brother noticed another patient with a pamphlet Bryanston Subacute and investigated further. So when Wayne was ready to leave the hospital, he came to us to continue his healing. Bryanston Subacute Wayne's experience needed full attention from our staff when he arrived. He was given a tracheostomy when he was on the respirator (the procedure in which a patient has a tube surgically inserted in his trachea and is helped to breathe through a respirator). As a result, she needed a vocal therapy to bring her vocal cords back to speed. I'm asking him about his therapy sessions with Ashira Segal. "It turns on more than me when I make the right sounds!" Ride. IThey put themselves to work, to build his upper body strength and maintain the muscles of the legs in a reasonable form. As Wayne says: "I ode the exercise with al was proud I never set foot in a gym. Feel the physiotherapists coming in the morning and you know it will be uncomfortable, but they are there to help you go." He also had the attention of our Labor Therapist, Ingrid who showed him how to deal with life in a wheelchair away from our facility. He remembers a day when he felt particularly pessimistic about his future and Ingrid decided to go out, so he took it for what he had to look like a wheelchair marathon around the neighborhood. He tells me how tired he was, "I was finished when we finally got back, but he showed me what I could achieve and that the feeling of sorry for me was not very productive." What else do you have to say about Bryanston Subacute's experience? He loves the feeling of being part of the "family". And the day 1 came to talk to him, he was sitting at family-style lunch with other patients. As I passed I heard one of the other patients comment on the fact that he had eaten all his lunch. I asked Wayne what this was about. "When I came here, I felt my life was over. I didn't want to eat. This place is like a holiday camp - at first you don't talk to anyone, but over time you get to know everyone and now I have a sense of belonging. I will be sad to leave, but I have to go on with my life." He came to Bryanston Subacute as a complete paraplegic and leaves as an incomplete paraplegic as his perspective has improved so dramatically during the weeks. A team of therapists will make home visits to keep the regime up and made the necessary changes at home, including hiring a full-time carer that had been vetted by Matron Rosemary Creating legs casts takes a team But one of the biggest adjustments will be the straps of the legs that have been customized made by Orthotist Pilane Evans. The casts were made ofof wayne and when they are ready, he will be able to wear them for betterwhen standing and hoping that in the end will be able to walk with crutches. Pilane with Wayne Wayne Wayne's "legs" is optimistic and aware that despite all the difficulties that these last months have brought him, he is lucky. "I'm lucky I can afford to make changes to my home and I can afford to hire a carer. I'm lucky to be in a family business, and my son could take action to handle it while I'm back, and I'm lucky to be alive." Says, adding: "For me, something that does not walk again is the second prize." We will stay in touch to keep updated its progress and hopefully it will make a significant recovery. Help raise a patient If you were visiting Bryanston Subacute a couple of weeks ago and happened to see a young man wearing our blue signature gloves and plastic apron (the super chic sign you are a member of the staff), you might have made a double grip. He seemed too young to be a qualified doctor. While we would like to say that he is 30 years in reality and discovered the legendary fountain of youth, we can not. Matthew is a student at Hilton College who spent part of his school vacation completing the service and outreach hours with us. Every day of his service he saw Matthew coming to start his shift at 7:00. At a time of day when most of us are reaching for coffee and trying not grouch, Matthew was always cheerful and willing to start the day. After the passage, he was matched to a staff member to be their right person (or left) for the day. Matthew had to do every uncontaminated job. She made beds, moistened floors after patients had showered to avoid slippers, raised patients from their beds in their wheelchairs then again in their beds. Matteo lends a hand with Physiotherapist, Elana Hato the back and pressure relief shifts and acquired knowledge about many aspects of care for the sick, the elderly and Bedridden. He also gained knowledge about howthe spread of Super Bugs, from which the gloves and aprons worn while working with the patients. During his time here his humanity shines. He crunched to see elderly patients face to face in their wheelchairs chatting with them showing respect and sweetness while treating them with dignity. One of the crucial aspects of rehabilitation is human contact and positive interactions, and Matthew only provided that on a daily basis. Matthew served countless cups of tea to our patients and helped them drink and eat when their hands were weak and fray. Thanks to Matthew for all his hard work and his phenomenal dedication to this work. Our first patient last year was Mr. Parsons. We celebrated his arrival with a lot of pomp and ceremony and said goodbye when he was mobile and able to go home. We missed the opportunity to take a photo of him when he entered for a visit earlier this year. We like it when our patients come back for a visit and show us how far they are progressing! Last week, we greeted Mr. Parsons again this time for rehabilitation. We hope to bring it back up and mobile so that it can come back for a visit of tea and cakes again. Elana Bierman, one of a team of physiotherapists who is contracted to our structure. He has a degree in Physiotherapy at the University of Free State. Its sunny layout and encouragement are a vital part of the motivation that raises our patients and walk. Design mobility plans for patients and realize which walking devices are most suitable for their needs. It is also extremely proficient in the creative resolution of rehabilitation problems. problems.
